Tasks	Effort (days)	
	Min.	Max.
Long term plans/suggestion		
Storage table scalability issue		
Completed records stored separately, older than 3 months entities moved to archive table	6	11
New: Replace table queries with queues to track files that are to be consumed	14	18
Reason: Instead of heavy operation of the storage table query, that is also queried when there are no relevant data in the table (eg. no In Progress files), the system will only consume from the queue when there is actual relevant data in the queue. This will reduce stress on the table and we follow best practices to use each storage: table for structured data like file location, status etc., and queues to create a backlog of work to process. Frequent querying on the table caused that sometimes, when the query timed out on logic app side caused to return no files, leaving files unprocessed		
Status Update failing due to not finding files		
Adding error handling to workflow (if file is already at the destination only tries to update table)	4	6
Tracking should only be done by table (long term solution - SSOT), blob storage only stores files	8	12
New: Cost optimization on Test systems (~\$550 potential savings monthly)		
Problem: env03-06 uses standard plan, even if stopped cost will not be reduced		
Suggestions:		
1. on env04 there is a Bastion service costing ~190\$/m, that serves no current purpose, given that access to the rg-aif-nonprod-env04 resource group is unnecessary		
2. env04 and env06 is not working correctly, and if they are not in use, team size and the current level of code complexity do not justify four separate test environments		
3. move env03 and env05 from standard plan to consumption plan and only run them if necessary, and have to make sure it is compatible as some connectors work differently in standard and consumption plans		
Research and review	4	6
Implementation	8	12
Total (Days)	44	65
